Orders priced at this rate for Vegetable Seeds, Peas, Beans, Sweet Corn, Lawn Grass, Grass Seeds and such heavy and unmailable goods as Field Corn, Roots, Seed Potatoes, Insecticides and Fertilizers will be shipped by Truck, Freight or Express, charges to be collected from the customer. If this class of goods must be shipped by parcel post please include postage with order.

TERMS OF SALE. Our regular terms are CASH WITH ORDER. Remittance by Bank Check, Post Office or Express Money Order is safest. Register letters containing money. Please do not ask for C.O.D. shipment unless you enclose 25% of the amount of the order. In conformity with other responsible seedsmen, Comstock, Ferre & Co. warrants to the extent of the purchase price that seeds, bulbs or plants sold are as described on the container within recognized tolerances. Seller gives no other further warranty, express or implied.

SPECIAL QUOTATIONS. Prices, particularly of Field Seeds, depend upon market conditions and are subject to change without notice. We will quote large quantities at prices as low as the highest quality of seed will permit. Let us quote you current prices on Grass and Field Seeds, Seed Potatoes and Onion Sets.

SEED TREATMENT. The treatment of seeds before planting is good insurance against loss and poor stands due to unfavorable weather and soil conditions. The so called failure of seeds to germinate is more often due to outside influences than any fault in the seeds themselves. The most effective materials we have found for seed treatment for good general use are Spergon and Phygon. These are particularly effective on Beans, Beet, Corn, Spinach and Squash and beneficial to a lesser degree on many other seeds. It is important that the right amount of the right material be used or germination may be retarded.

We recommend that our customers use these materials only with the most recent instructions of manufacturers and Experiment Station authorities. Upon request we can furnish seed on bulk orders treated as required at a slight advance in price, but we do not guarantee or hold ourselves responsible for results.

MAIL ORDERS. In the shipping season we endeavor to give prompt service on orders, and give special attention to seeds needed for immediate planting. During the rush season some delay is inevitable as we are called upon to supply an ever increasing number of orders in spite of being hampered by uncertain and slow delivery of our seed supplies. Early orders are advisable, particularly for seed to be sown in greenhouses and cold frames for growing early plants. Very early orders for general garden planting may have to be held for economical handling until crops of seed are received and packaged.

CONNECTICUT SALES AND USE TAX. Residents of Connecticut are liable for and we must collect a tax of 3% upon a few items, such as Plant Labels, Twines, Paper Pots and feed for pets, such as Dog Feed and Bird Feeds.

BEFORE MAILING YOUR ORDER. Write your name, address and shipping point in full and plainly on the order sheet. Be sure to give nearest freight or express station if different from your post office address.

We will gladly send copies of this catalogue to any of your friends who may be interested.

High Quality Seed Produces Fine Lawns

LAWN GRASS MIXTURES

The quality of a lawn depends as much upon the kind of seed sown as the care in preparation of the soil. Our mixtures are carefully planned, each to meet some particular condition of soil or use. The grasses used are selected for such high purity and germination with a negligible content of weed seeds and waste that each pound is sufficient to sow 200 sq. ft. or more. We will be glad to advise you as to special mixtures for any unusual conditions. Grass varieties are listed on page 43. Add postage for quantities of 5 lbs. or more.

Kentucky Wonder

B E E T

Beets may be sown as early as the ground can be worked and may be planted in succession until the first week in July. They grow well in all but the most acid soil and provide not only tender and delicious young beets, but tasty greens when the young plants are cooked entire. Sow in 14 inch drills ½ to 1 inch deep and thin to 3 inches. Use the thinned out plants for greens. Treatment with Phygon materially aids germination and produces a healthy growth.

Transplant in rows 3 feet apart, leaving 5 to 4 inches between plants, or for extra large stalks 6 to 8 inches. Keep well cultivated and as cool weather approaches draw the soil up around the plants. Continue until only the tops of the plants remain uncovered. Blanching of early Celery is often accomplished with boards or building paper set against the rows instead of soil. Late Celery should be pitted or placed in cellars before freezing weather.

Chemically treated seed helps germination in cold wet soil and prevents damage by insects and disease. We use the most improved materials. On the most used varieties we can supply seed sorted into flat and thick kernels. The flat kernels are more uniform size and are recommended for use in corn planters, while the thicker kernels are equally good for smaller plantings.

SWEET CORN

Sweet Corn is tender and will not stand frost, nor will it germinate well in wet cold soils. It responds to good soil and clean, frequent shallow cultivation. Plant in well fertilized hills 3 feet apart each way, putting 5 or 6 kernels in each hill and covering to a depth of not more than 1½ inches. When 6 inches high remove all but the 3 most vigorous stalks from each hill. For a succession throughout the season plant several varieties early in May, including first early to late varieties. A good main crop variety planted at intervals of two weeks until the middle of July will produce a continuous supply. Treatment with Spergon is very effective in insuring the germination, especially for early plantings, and controls seed borne diseases. For prices of Spergon see page 44.

Hybrid White Varieties

To meet the demand for white corns of equal or better quality than the popular yellow hybrids we are listing two of the most outstanding white hybrids. PEAS

Peas should be sown as early as possible in order to mature before the hot summer weather. To secure an extra early crop the smooth seeded varieties may be sown just as soon as the ground can be worked. The wrinkled varieties are not quite as hardy and should be planted a little later. Sow 2 or 3 inches deep in single or double rows 3 to 4 feet apart. The tall growing sorts require brush or other support. This is not so necessary for the dwarf varieties but they are greatly benefited if kept off the ground. Inoculation of the seed before planting with Nodogen increases the crop and enriches the soil.

May be sown in spring as early as the ground can be worked, either in rows or broadcast. Summer sowings should be on freshly plowed ground and the soil must be packed hard about the seed, as it will not germinate in dry soil.

SQUASH

Warm and highly manured soil is required for the most successful culture of Squash. The summer kinds, nearly all of which are bush growth, should be planted in hills 4 feet apart each way, while the winter and other running varieties require 8 to 10 feet. When thinning, leave only 3 or 4 plants to a hill. Dusting with Rotenone dust is effective to control the Striped Cucumber Beetle.

To furnish desirable early plants the seed should be sown in February or March in a hotbed or box kept in a warm place. When the plants are about 2 inches high they should be thinned or transplanted to ensure stocky plants. As soon as danger from frost is past transplant to the open ground, setting about 3 feet apart each way. They should be frequently cultivated and well-fertilized. The fruit will ripen earlier and be improved in quality if the vines are pruned to two stems and trained to stakes or trellises. Plants for late summer crop may be started from seed in May.

ANNUALS

Flowers That Bloom the First Year From Seed

The best of success with many annuals may be had by sowing them in beds where they are to flower. The hardier varieties such as Calendula, Larkspur, Centaurea and Poppy may be sown very early, while the more tender, as Balsam, Nasturtium, Marigold and Zinnia, are best planted later when the ground has become warm. Prepare the soil carefully, making it soft and fine, and sow the seed broadcast or in rows. When large enough, thin the seedlings so that they stand about half as far apart as their maximum height. If a hotbed or coldframe is available many kinds may be started earlier and transplanted, hastening the blooming period. Perennials listed on page 38.

CORNELL M4 For early grain

GRAIN AND ENSILAGE CORNS

Ensilage Varieties

Later, leafier varieties producing heavy tonnage of ensilage per acre. Many will yield heavy crops of ears if planted early and spaced thinly for each stalk to develop. The hybrid varieties have strong root systems and usually outyield the open-pollinated kinds.

SWEEPSTAKES, WESTBRANCH (Red), 110 days. Earliest true ensilage corn which produces mature ears in this climate.

PENNA. 602 (Hybrid) 100 days. Early husking and ensilage variety. Ears and stalk medium to large, strong stalked, resistant to many diseases, a very dependable corn for general use.

IOWA 4059 (Hybrid) 115 days. Strong stalked, leafy and vigorous, in many respects similar to U.S. #13, but slightly earlier.

U. S. #13, (Hybrid), 120 days. Outstanding for strong stalks and well braced root system enabling the corn to withstand heavy rain and wind. Reliable for grain as well as ensilage.

CONN. 870, 120 days. Improved variety from the Conn. Agricultural Station. A heavy producer adapted to New England conditions, similar in growth and season to U. S. #13.

WETHERSFIELD, CONN.

Grain Varieties

YELLOW CANADA, 100 days. Sometimes called 90-day yellow. The common 8-rowed flint corn of New England. Our strain produces particularly fine crops with large uniform ears.

OHIO M15 110 days. Standard yellow dent grain corn. Outstanding for yield. Ears are good size with deep kernels.

All of the above will be supplied
at Market Prices

Most of the hybrid varieties are treated with approved fungicides to assure the best possible stands. The seed is also sized for more even planting.

CROW REPELLENT

GRANULATED PEAT MOSS

The increasing use of Peat Moss for gardens shows a better understanding of its value. It is a vegetable product which remains in the soil for many years contributing to the formation of humus, making the soil more porous, and improving its general texture and condition. It contributes effective drainage and is a reservoir for storing moisture and air, thereby favoring plant growth. Also used for mulching perennial and rose beds, as well as around evergreens, retaining the moisture so necessary to their growth.
